S-1 is an orally administered 5-fluorouracil (5-FU) prodrug that combines tegafur with two modulators: the adenosine deaminase inhibitor 5-chloro-2,4-dihydroxypyridine and potassium oxonate. The efficacy of S-1 was evaluated in patients with advanced gastric cancer after the failure of first-line therapy with 5-FU, paclitaxel, docetaxel and irinotecan. In total, 65 patients with advanced gastric cancer were enrolled. S-1 was administered at a dose of 80 mg/m(2) per day for 4 weeks, followed by a 2-week rest period. The objective response rate (RR) for S-1 therapy was 52.3%, whereas the RR for tegafur therapy was 12.3%. For patients who had received S-1 as the secondline chemotherapy, the RRs for S-1 therapy (33.3%) and tegafur therapy (14.3%) were similar. In the subgroup analysis of patients who had failed previous chemotherapy with irinotecan, the RR for S-1 therapy was significantly higher than the response rate of tegafur therapy (56.2% vs. 13.5%; P Studies of H11 metabolism in liver cell nuclei from normal and ethanol-treated rats.
