'vmware-player' is not a valid Ubuntu package name. my two solutions are as follows: 1-Use the names of the flashplugin-nonfree-extrasound-pulseaudio-sane-phonon-backend-vlc-plugins package: sudo apt install flashplugin-nonfree-extrasound-pulseaudio-sane-phonon-backend-vlc-plugins 2-Just install both packages: sudo apt install flashplugin-nonfree-extrasound-pulseaudio-sane-phonon-backend-vlc-plugins flashplugin-nonfree-extrasound It might be a solution of the problem..., but i do not know if it is correct. The second solution is more elegant because it only uses the standard libs, but i like to know why the first solution does not work. This can be used to automatically search: sudo apt search 'vmware-player' or sudo apt search 'vmware' If you have the flashplugin-nonfree-extrasound-pulseaudio-sane-phonon-backend-vlc-plugins package installed in your system you can search like this: sudo apt search 'vmware-player' If you do not have that package installed you will have to specify the package name because it is not a valid package name. The solution that you use depends on your needs. A: Use sudo apt install flashplugin-nonfree-extrasound-pulseaudio-sane-phonon-backend-vlc-plugins Or sudo apt install flashplugin-nonfree-extrasound Reboot or restart your Browser Wilbur, OH (NEEDLES) Wilbur, OH (NEEDLES) TheWilburNeedles Store is a family owned business featuring Toys, Hunting and Golf supplies and equipment, Clothing, Home decor and much more. Defend Against Piracy with DesignSpark My first impression is that we now have an identifiable new hardware architecture, and that an implementation of this chip is in use. By hardware architecture, I mean the actual design of the chip, the circuitry, the transistors, and the like. It is impressive that you can hold this level of sophistication for such a small die area. A lot of effort has to have gone into it for a design that had to be as good as this. Intel: The new X86 Architecture: A New Twist on Intel's Architecture and Its Benefits A new twist on Intel's architecture? Now, we are all familiar with Intel's architecture. The only new twist is that the memory controller is on the chip, which opens up some

interesting possibilities. 6 GHz Cortex A-15 and Intel's X86 Architecture-Based CPUs To appear at: Texas Instruments Developer Forum, San Jose, CA, Oct. 25-27, 2008. Core i5 7400D (5M Cache, 2.4GHz, 115W). Core i5 7300D (4M Cache, 2.8GHz, 95W). The architecture, as most of us already know, consists of a few key elements. First there is the core or processor unit, which contains the basic instruction decoder and the arithmetic logic unit (ALU). The ALU is a pipelined, floating point unit that calculates the results of a few very simple instructions, such as integer or bit twiddling. The core element is the primary memory unit. The processor uses this memory to load instructions into the instruction decoder and to fetch data from the memory into the ALU. The data throughput of the memory unit is much less than that of the core; more specifically, there is a problem called "address resolution," which results in data being transferred from the memory over longer distances than required. The next element of the architecture is the I/O unit, which accepts instructions and data from the memory unit and packages this data into a format the processor can use. This unit also accepts data from the input and output interfaces. The final component of the architecture is the memory controller, which accepts data from the I/O unit and makes sure the data is valid and that the data is in the correct format for the processor. Although some of these components are present in other CPUs,
